                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ठे
                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method (M1) for producing an oil body associated with a recombinant multimeric protein complex (MPC). M1 comprises producing in a cell comprising oil bodies a first and second recombinant polypeptide (P1, P2), where P1 is capable of associating with C F2 to form the MPC and associating the complex with an occlusion body (CB) through an OB-targeting-protein capable of associating with GB and C P1. M1 is useful for producing an oil body associated with a recombinant MPC. The oil bodies are further formulated for use in the preparation of a food product usus as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface area of the human body or used to lighten the skin, or a pharmaceutical composition used to treat chronic obstructive pulmonary disease (CDPD), cataracts, diabetes, envenomation, bronchologulmonary disease (CDPD), cataracts, malignancies, reperfusion injury, wound healing, sepsis, gastro casophageal reflux disease). MI comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to

                                                                                                                                                                                        1039 CAAGACAAGAAGTATAGACAGGCCATCACTGCTGCAGGAACTGGGTGCATGGCGGCATTG 1098
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid arrepresentative of expressed polyvucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiditic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.
                                                                                                                                                                                  t t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

reductase eliminates the need to develop exogenous sources for addition during processing. Secondly, physical disruption of seed integrity is not necessary to bring the enzyme in contact with the storage or matrix proteins of the seed prior to processing or as an extra processing step.

M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2 2

                                                                               ठ
                                                                                                                                ò
                                                                        The present invention relates to the isolation and use of the barley thioredoxin h and NADPH-thioredoxin reductase coding and protein sequences. Thioredoxin is thought to be involved in plant development via its function in the reduction of disulfide bridges. Thioredoxin can be used in hair care products and in the neutralisation of some venoms and toxins, and is also useful in the reduction of some food, for example it some broteins. It can also be used to enhance the digestibility of cereal flour.

The present invention relates to a transgenic plant comprising heterologous DNA coding for eukaryotic thioredoxin reductase integrated into its nuclear or plastid genome and use of thioredoxin reductase for separating the starch and protein components of grain in a milling process. Transgenic plant is used for separating the starch and protein components of grain in a milling process. Transgenic plant may be used to produce thioredoxin reductase at elevated levels. Delivery of thioredoxin
                                                                                                                                                                                                                                                                                                                            899
                                                                                                                                                                                                                                                                                                                                                                                320

NOTE: It currently consists of 1 contige. Gaps between the contigs
are represented as runs of N. The order of the gaps between them
are based on estimates that have provided by the submitter. This
sequence will be replaced by the finished sequence as soon as it is
available and the accession number will be preserved.

On Sep 3, 2003 this sequence version replaced gi:15594177.
The orientation of the sequence of this BAC clone was generated by
combining Monsanto and RGP-Japan sequencing data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       99747
